Project Design Phase-I
Problem – Solution Fit Template

Date	—	**Team ID**	—
Project Name	Global Fuel Prices & Taxation (2020–2026)	**Maximum Marks**	2 Marks

Problem – Solution Fit:

People who compare fuel prices across countries often need to bring together information about petrol, diesel, LPG, taxation and changes over time. When these measures are spread across rows of data, it can be difficult to spot regional differences or understand how prices vary by income level. This project organizes the available data in Tableau dashboards so users can explore these patterns through maps, comparisons and trends.

Purpose:

- ☐ Turn the fuel-price dataset into clear, comparable visual information.
- ☐ Compare average petrol, diesel and LPG prices across regions and income levels.
- ☐ Explore fuel-price trends over the 2020–2026 period and compare taxation with petrol prices.
- ☐ Support quicker exploration through dashboard views, labels and Region / Income Level filters.
- ☐ Help students, researchers and other interested users identify patterns for further investigation.

Problem–Solution Fit Canvas (adapted for this project):

1. TARGET USERS

Students, researchers, policy-focused readers and people interested in international fuel-price differences.

2. USER NEEDS & CONSTRAINTS

Users need readable comparisons across countries and regions. The analysis is limited to the fields and dates available in the supplied dataset.

3. AVAILABLE SOLUTION

A Tableau workbook with a global petrol map, regional price charts, a fuel-price trend chart, tax comparison, income-level view and scatter plot.

4. JOBS TO BE DONE

Find where average fuel prices are higher or lower, compare fuel types, and review how values change from 2020 to 2026.

5. ROOT PROBLEM

Raw tabular data can make regional patterns, changes over time and relationships between taxation and petrol prices harder to interpret quickly.

6. EXPECTED BENEFIT

A single visual overview makes the data easier to scan and compare; findings remain descriptive and do not by themselves prove causation.

7. TRIGGERS

A user wants to compare a region, inspect a country on the map, check a fuel-price trend or explore tax-related differences.

8. SOLUTION / EXPERIENCE

Use average aggregations for price comparisons, sort charts where useful, read labels and tooltips, and apply Region or Income Level filters.

9. ACCESS & SHARING

The workbook and dashboard can be reviewed in Tableau. An exported PDF or image can be shared when a static summary is needed.
