Project Title	Global Fuel Prices & Taxation (2020–2026)	**Maximum Marks**	3 Marks

Project Proposal (Proposed Solution)

This proposal describes a Tableau-based analysis of global fuel prices and taxation. It defines the project objective, scope, problem, proposed approach and resources required to turn a structured Excel dataset into clear visual comparisons.

Project Overview	
Objective	To build an interactive Tableau workbook that helps users explore petrol, diesel and LPG prices, compare average fuel prices across regions and income levels, review trends from 2020 to 2026, and examine fuel taxation alongside petrol prices.
Scope	The project uses the supplied Excel workbook and fields for Country, Region, Income Level, Date, Petrol Usd Liter, Diesel Usd Liter, Lpg Usd Liter, Tax Percentage, Subsidy Level and Brent Crude Usd. It includes eight worksheets, a global overview dashboard, filters and a Tableau Story. It focuses on descriptive visual analysis; real-time feeds, forecasting and causal conclusions are outside the current scope.
Problem Statement	**Description** Fuel-price and taxation data can be difficult to interpret when values are held in rows across countries, regions and dates. Users may struggle to compare fuel types, identify regional differences, and understand how prices vary with income level or taxation without assembling several separate views.
Impact	A unified visual workbook makes the available data easier to explore and compare. It can help students, researchers and other interested users identify patterns, ask better questions and communicate observations. The charts show associations and differences; they do not, by themselves, prove that taxation causes a particular fuel price.

Proposed Solution

Approach	Connect Tableau Desktop directly to the Excel workbook, review field types and geographic roles, use average (AVG) aggregation for fuel-price and tax comparisons, create individual worksheets for the project questions, and combine the views into a dashboard and Tableau Story. Use labels, sorting, tooltips and Region / Income Level filters to make exploration easier.
Key Features	Global petrol-price map; regional petrol-price comparison; fuel-price trends from 2020–2026 for petrol, diesel and LPG; fuel taxation comparison; diesel and LPG price comparisons by region; petrol price by income level; and taxation versus petrol-price scatter plot. The workbook contains eight worksheets and an overview dashboard with interactive filters.

Resource Requirements

Resource Type	Description	Specification / Allocation
Hardware	Computing resources	A standard laptop or desktop capable of running Tableau Desktop and Microsoft Excel.
Memory	RAM	Sufficient memory to run Tableau and the source workbook smoothly; actual needs depend on dataset size.
Storage	Space for source data and workbooks	Local storage for the Excel dataset and saved Tableau workbook (.twb or .twbx), with backup as appropriate.
Software	Analysis and data source	Tableau Desktop and Microsoft Excel / compatible spreadsheet software.
Visualization tools	Charts and calculations	Tableau maps, horizontal bar charts, line chart, scatter plot, filters, labels, sorting and built-in AVG aggregation.

SMARTBRIDGE
Let's Bridge the Gap

Development Environment and Data

Component	Description	Specification / Allocation
Development Environment	Software used to create and maintain the project	Tableau Desktop for worksheets, dashboards and Story; Microsoft Excel workbook as the source. Save working versions as Tableau workbook files (.twb or .twbx).
Data Source	Source, format and fields	Excel (.xlsx) dataset connected directly to Tableau. Fields used include Country, Income Level, Region, Subsidy Level, Brent Crude Usd, Date, Diesel Usd Liter, Lpg Usd Liter, Petrol Usd Liter and Tax Percentage.
Data Preparation	Checks before visualization	Review field types, confirm Date is treated as a date, assign Country a geographic role where needed, and use AVG rather than SUM for fuel-price comparisons so repeated observations are not added together as if they were separate prices.
Project Output	Deliverables	Eight worksheets, a Global Fuel Overview dashboard, a Tableau Story and supporting project documentation. The views support regional, income-level, time-series and taxation comparisons.

Project Limitations

The analysis is limited to the available dataset and its recorded fields. Data quality and coverage determine how representative the comparisons are. The dashboard is descriptive and should not be interpreted as a forecast or proof of cause and effect. No SQL/MySQL database or separate Python/Flask application is claimed as part of the current implementation.
