Scalability & Future Plan

Date	—
Team ID	—
Project Name	Global Fuel Prices & Taxation (2020–2026)
Maximum Marks	1 Mark

Scalability & Future Plan:

This document describes how the Global Fuel Prices & Taxation Tableau project could be extended to support more countries, longer time periods, more frequent data updates, and additional analytical features. The current workbook compares petrol, diesel and LPG prices with regional, income-level and taxation views.

Current System Limitations:

S.No	Limitation	Impact	Priority to Address
1	The workbook relies on a prepared dataset rather than a live feed.	Charts may not reflect the latest fuel prices or tax changes.	High
2	The current comparisons use predefined fields and categories.	New countries, regions, or fuel indicators require data and workbook updates.	Medium
3	The dashboard mainly presents descriptive comparisons and historical trends.	It does not forecast future prices or estimate the effects of policy changes.	Medium

Scalability Plan:

S.No	Scalability Aspect	Current State	Proposed Upgrade / Solution
1	Data updates	Prepared file-based dataset.	Connect to a maintained database or trusted data source and schedule refreshes where available.
2	Data volume	Analysis based on the current dataset.	Use efficient extracts, data aggregation, and filters as the number of countries and dates grows.
3	Dashboard access	Workbook/dashboard created in Tableau.	Continue sharing through Tableau Public for public access; use Tableau Cloud/Server if controlled access is required.
4	Analytical features	Regional bar charts, map, trend lines, and tax-price scatter plot.	Add more indicators, time-period comparisons, forecasting, and policy scenario analysis as data quality permits.

Future Roadmap

The phases below are proposed future enhancements, not features already implemented in the current workbook. Timelines are indicative and depend on data availability and project scope.

Phase	Planned Feature / Enhancement	Target Timeline	Expected Impact
Phase 1	Review the current dashboard, validate country names and units, and document data sources and limitations.	Short term	Improves clarity, consistency, and confidence in the comparisons.
Phase 2	Expand the dataset with additional dates and reliable updates for petrol, diesel, LPG, crude oil, and taxation.	1–2 months	Provides more current information and supports longer-term trend analysis.
Phase 3	Add forecasting and what-if analysis for fuel prices and tax changes, subject to sufficient historical data.	3–4 months	Helps explore possible future patterns and policy scenarios.
Phase 4	Improve mobile-friendly layouts and add related indicators such as subsidies or energy-policy information where reliable data exists.	Around 6 months	Makes insights easier to access and broadens the context for comparing countries.
